The gouldian is a colourful bird only found in Australia. They mostly live in grasslands with eucalyptus trees near water. The birds eat seeds but they don't swallow them whole. First the bird uses the sharp cutting edges of its beak to tear the husk off each seed. Pluck, husk, swallow, the bird eats seed by seed. This job goes quickly because their beaks are adapted for this task.

These social birds gather in big flocks around water holes. After they have a drink and a bath, they clean one another. They also hang out in family groups of parents and their young ones. The birds build a ball-shaped nest in a hollow tree. The females and males take turns in keeping the eggs warm and feeding the chicks when they hatch. The chicks have light-reflecting beaks which help the parents to find their mouths in the dark.
